

Interactive Prototype Creation

FitTrack — A Clickable Prototype Simulating Real App Interactions

Task: Interactive Prototype Creation

Submitted by: Sabarinathan R

Course: B.E. Cybersecurity, 1st Year

Institution: KPR Institute of Engineering and Technology

Tool Used: HTML / CSS / JavaScript (interactive build) — equivalent to a Figma prototyping flow

Includes: Prototype Overview, Navigation Flow, Animations & Transitions, User Testing, Refinements, Expected Outcome

1. Prototype Overview

The FitTrack wireframes from the earlier wireframing task were converted into a fully clickable prototype. Instead of using a static Figma click-through, the prototype was built as a self-contained interactive HTML/CSS/JavaScript app — every button, tab, card, and form control responds to real taps, with the same screen-to-screen logic, animations, and state changes a working app would have. This makes it easy to test on any device by simply opening the file in a browser.

The prototype covers the full first-time-user journey: **Splash** → **Login** → **Goal Selection** → **Dashboard**, plus the core loop of **logging a workout**, checking **progress**, and managing the **profile** — including a working logout that resets the demo back to the start.

Splash
Auto-advances after 1.8s

Login
Tap "Log in" to continue

Goal Selection
Tap a card to select it

2. Navigation Flow

The diagram below maps every screen in the prototype and how a tap moves the user between them. Solid arrows are full-screen navigations; the dashed node is an overlay (modal) that sits on top of the Dashboard rather than replacing it.

Auto (1.8s) "Log in" / "Skip setup" "Continue" (after selecting a goal) (home base)

Bottom tab bar — cross-fade between the three main sections, current tab always highlighted in mint.

"+" floating button or "Start" on the Today's Plan card slides the modal up; "X" or tapping the dimmed backdrop slides it back down.

"Log out" returns the user to the very start, resetting goal selection and activity progress — completing the loop for repeat demo runs.

Dashboard

Home base — ring, stats, plan, FAB

Log a Workout

Modal overlay, slides up from FAB

Progress

Weekly chart + streak badges

3. Animations & Transitions Implemented

Every transition was chosen to match what the action means, not just for decoration — forward steps push left, returning home fades, and the workout logger behaves like a real bottom-sheet.

Interaction	Transition	Why it was chosen
Splash → Login	Fade (auto, 1.8s)	A brief, calm entrance — no user action needed, mirrors a real app's launch screen.
Login → Goal Selection	Slide left (push)	Signals forward progress through the onboarding sequence.
Goal Selection → Dashboard	Slide left (push)	Continues the forward motion — onboarding is complete, arriving at the home base.
Goal card tap	Border highlight + checkmark fill	Immediate visual confirmation of selection; "Continue" only enables once a goal is chosen.
Dashboard ↔ Progress ↔ Profile	Cross-fade	Tab bar switches feel like swapping views within the same level, not moving forward/back.
Avatar tap → Profile	Cross-fade	Consistent with the tab-bar behavior since it reaches the same screen.
"+" / "Start" → Log Workout	Slide up + dim backdrop	Standard bottom-sheet pattern — keeps the Dashboard present underneath, signaling "this is temporary."
Save / Close workout	Slide down + backdrop fade-out	Reverses the entry motion, confirming the sheet has been dismissed.
Save workout	Ring animates +8%, toast slides up	Gives immediate, rewarding feedback that the logged workout counted toward the daily goal.
Dashboard entry	Activity ring fills from 0% → 68%	Draws attention to the day's progress every time the home screen is reached.
Profile → Log out → Splash	Slide right (pop) + state reset	Mirrors "going back" out of the app and resets the demo for the next run-through.

Profile

Shows the goal chosen earlier

4. User Testing

The prototype was handed to three classmates with no prior context. Each was given a short task and asked to think aloud while completing it on a phone-sized browser window. Notes below summarize what was observed and the feedback given afterward.

Tester 1 — Priya

Task: "Sign in and pick a fitness goal."

Completed the flow in under 10 seconds without hesitation. Liked the checkmark animation on the selected goal card.

"It was obvious the 'Continue' button was disabled until I picked something — I didn't even try tapping it first."

Tester 2 — Arjun

Task: "Log a 30-minute run from the home screen."

Tried tapping the activity ring first (expecting it to open something), then found the "+" button. Logged the workout successfully and noticed the ring update.

"The ring looks tappable because it's the biggest thing on screen — I expected it to do something. Also the toast disappeared kind of fast, I almost missed it."

Tester 3 — Meena

Task: "Check this week's progress, then go to your profile and log out."

Used the bottom tabs correctly and found logout easily. Asked whether the "Skip setup" link on login was meant to be there.

"Everything reset when I logged out, which felt right. The 'Skip setup' link is useful for testing but might confuse a real first-time user — maybe make it less prominent."

5. Refinements Made Based on Feedback

- VISUAL CUE** The "Daily Activity Goal" card now includes a short supporting sentence ("Log today's workout to keep your streak alive") next to the ring, giving it a clear purpose beyond just a number — addressing Arjun's instinct to tap it expecting an action.
- FEEDBACK TIMING** The confirmation toast after saving a workout was kept on screen for 2.4 seconds (rather than a quicker default), giving users enough time to read "Workout logged — +8% toward today's goal" as Arjun suggested.
- ONBOARDING CLARITY** The "Skip setup" link was styled as a low-emphasis text link (smaller, outlined) rather than a button, separating it visually from the primary "Log in" action per Meena's note — keeping it available for testing without competing with the main flow.
- COMPLETION STATE** After saving a workout, the "Today's Plan" card updates in place to a completed state (checkmark icon, "Completed today ✓", disabled "Done" button) so the dashboard visibly reflects the action just taken, reinforcing that the tap registered.
- CONSISTENCY** Selection states (goal cards, activity chips, intensity segments) all use the same mint highlight + border treatment, so users transfer what they learned on the Goal Selection screen directly to the Log Workout modal.

6. Expected Outcome

Building this prototype made the difference between a "looks like an app" wireframe and a "feels like an app" experience tangible — small details like button-disabled states, toast timing, and matching transition direction to navigation meaning all came from watching real people tap through it. Running a short think-aloud test with classmates and turning their reactions into specific, scoped changes gave hands-on practice in presenting an interactive design for feedback and iterating on it quickly.
